

# **CHARACTER LCD MODULES**

## **USER'S MANUAL**

## 1. GENERAL

Character Liquid Crystal Display Modules are high-contrast, wide-viewing-angle and low-power-consumption display incorporating CMOS LCD controller. The LCD controller has a built-in character generator ROM/RAM and display data RAM, and all the display functions are controlled by instructions. Therefore the LCD module can easily be interfaced with an MPU. This makes the module applicable to a wide range of purposes including terminal display units for microcomputers and display units for measuring equipment.

The table below shows model names of character LCD modules according to the number of characters displayed. Each model has standard specifications and optional specifications such as built-in LED backlight type, built-in EL backlight type, wide-temperature-range type. Standard specifications and other optional specifications, see the reference page of each model shown in the table below.

## 2. PRECAUTIONS

### 2.1 Handling the LCD Module

#### Safety

- If the LCD panel is damaged, be careful not to get the liquid crystal in your mouth and not to be injured by crushed glasses.
- If you should swallow the liquid crystal, first, wash your mouth thoroughly with water, then, drink a lot of water and induce vomiting; and then, consult a physician.
- If the liquid crystal should get in your eye, flush your eye with running water for at least fifteen minutes.
- If the liquid crystal touches your skin or clothes, remove it and wash the affected part of your skin or clothes with soap and running water.
- High voltage is applied to the lead terminals of the EL lamp. Do not touch any part of the lead terminals.(For LCD modules with EL backlight)
- Do not use EL inverters without a load or in the short-circuit mode.
- Use the LCD module within the rated voltage to prevent overheating and/or damage. Also, take steps to ensure that the connector dose not come off.

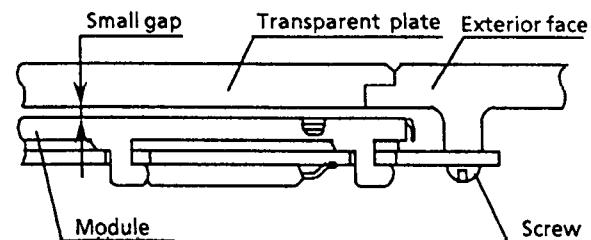

#### Handling

- Avoid static electricity, as it may damage CMOS LSIs mounted on the module..
- Since the LCD panel has glass substrate, avoid applying mechanical shock or pressure on the module. Do not drop, bend, twist or press the module.
- Do not disassemble the module.
- Since the polarizer is made of easily-scratched material, be careful not to touch or place objects on the display surface.
- Keep the display surface clean. Do not touch it with your skin.

#### Mounting and design

- Use the specified mounting parts and holes to mount the module.
- Make sure that no stress is applied on the module when it is mounted; stress applied for a long time may damage the LCD panel and the IC substrates.
- Connect a  $10\text{-}\mu\text{F}$  capacitor between the power supply terminals to eliminate noise.
- To protect the polarizer and the LCD panel, cover the display surface with a transparent plate (e.g., acrylic or glass) with a small gap between the transparent plate and the display surface.

#### ★ Example

- Do not apply input signals when power supply voltage is not applied.
- Avoid condensation, or the transparent electrodes may break. Use the module within the specified temperature range.

#### Storage

- Store the module in a dark place, where the temperature is  $25 \pm 10^\circ\text{C}$  and the relative humidity below 65%. If possible, store the module in the packaging situation when it was delivered.
- Do not store the module near organic solvents or corrosive gases.
- Keep the module (including accessories) safe from vibration, shock and pressure.
- Use the products within 6 months of receiving it. (For LCD modules with EL backlight)
- Because the EL backlight uses organic materials that are very sensitive to heat and humidity, there may be some loss of quality when stored for long periods of time. Contact SII for further detail.
- Black or white air-bubbles may be produced if the module is stored for a long time in the lower temperature or mechanical shocks are applied onto the module.

## Cleaning

- Do not wipe the polarizer with a dry cloth, as it may scratch the surface.
- Wipe the module gently with a soft cloth soaked with a petroleum benzine.
- Do not use ketonic solvents (ketone and acetone) or aromatic solvents (toluene and xylene), as they may damage the polarizer.

## **2.2 Handling the LED Backlight Unit**

- When soldering the connector for LED backlight unit, the soldering iron temperature should not exceed 260°C, and soldering time should be within 3 seconds.  
(L1681, L1672, L1692, L2032, L4051, L4052)
- For cleaning, wipe with soft cloth and use only the following chemicals.
  - Ethanol
  - Isopropyl alcohol

## **2.3 Mounting of an EL Lamp and an Inverter**

- Your design should make it easy to replace EL lamps since they have a shorter service life than the other components of LCD modules.
- Do not bend the EL leads when soldering them on the circuit board of the LCD modules; otherwise they may break.
- To set an EL lamp in an LCD module, push the EL lamp with its emitting side up, without pushing the rubber connectors too hard. If you damage them, the LCD module may not work properly.
- Do not damage the film surface of the EL lamp; otherwise the lamp will be damaged by humidity.

### 3. RELIABILITY

#### 3.1 Reliability Test

##### (1) Standard type

Test item	Test conditions	Results
High temp. and humidity operation*	40°C ± 2°C 90%RH 500 hours	No abnormalities in functions** and appearance***
High temp. operation*	60°C ± 2°C 500 hours	
Heat shock*	-20°C ± +60°C : 10 cycles 1 hour at each temp. 5 min. transition	
Low temp. storage*	-20°C ± 2°C 500 hours	
Vibration	Sweep : 10 Hz to 55 Hz 1 min/cycle Amplitude : 1.5 mm 2 hours in X, Y and Z directions	
Drop shock	Hight : 30 cm Dropped onto a board	

##### (2) Wide temperature range type

Test item	Test conditions	Results
High temp. and humidity operation*	60°C ± 2°C 90%RH 500 hours	No abnormalities in functions** and appearance***
High temp. operation*	80°C ± 2°C 500 hours	
Heat shock*	-30°C ± +80°C : 10 cycles 1 hour at each temp. 5 min. transition	
Low temp. storage*	-30°C ± 2°C 500 hours	
Vibration	Sweep : 10 Hz to 55 Hz 1 min/cycle Amplitude : 1.5 mm 2 hours in X, Y and Z directions	
Drop shock	Hight : 30 cm Dropped onto a board	

#### 3.2 LC Panel Life Time

Item	Conditions	Standard	Unit
Life time	25°C ± 10°C ≤ 65% RH	100,000 or more	hrs

##### - Definition of life time

- (1) Contrast reduces to 30% of the initial value.
- (2) Current consumption becomes three times the initial value.
- (3) Orientation deteriorates significantly.
- (4) The display malfunctions.

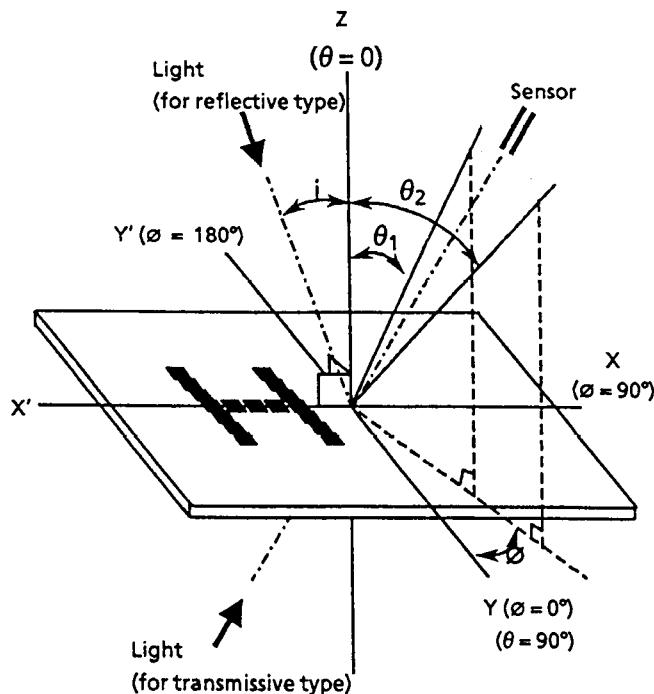

\* Measurement conditions: Evaluation and judgment of the module should be done two hours after it is returned to room temperature. There should not be any condensation during the test and the ensuing evaluation.

\*\* Current consumption, contrast and display functions

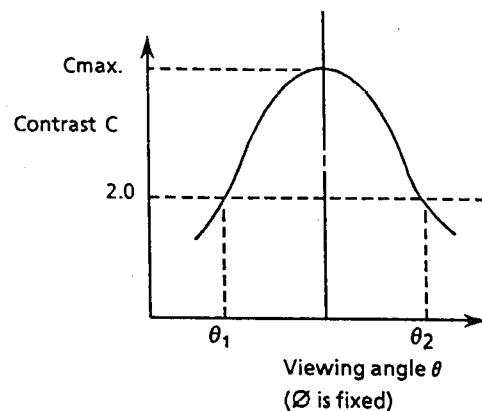

\*\*\* Polarizer deterioration and other appearance defects

#### 4. DEFINITION OF OPTICAL CHARACTERISTICS TERM

##### ■ Angles $\phi$ and $\theta$

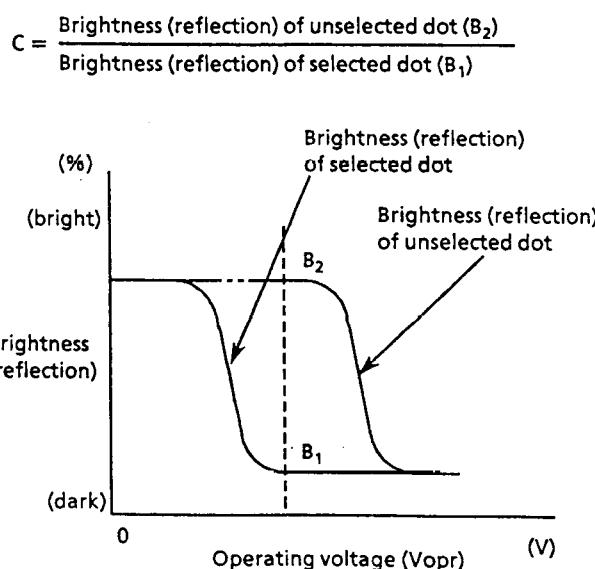

##### ■ Viewing angles $\theta_1$ and $\theta_2$

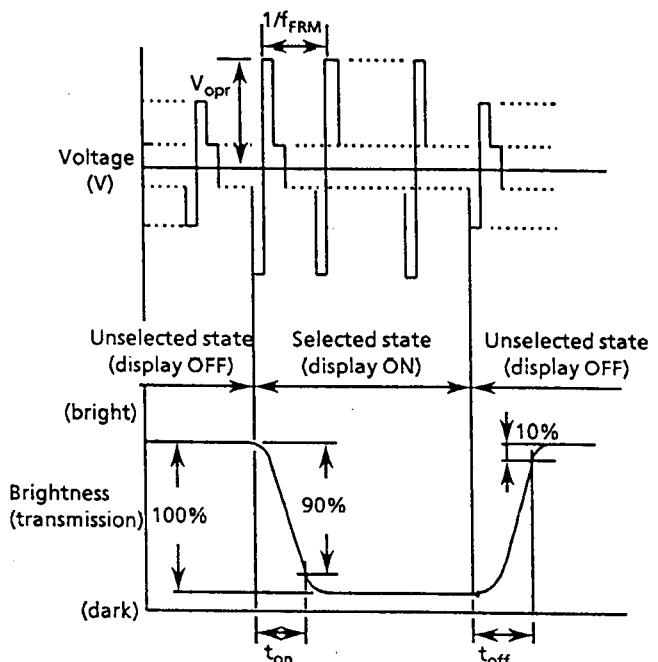

Remark: The optimum viewing angle by visual inspection and angle  $\theta$  at  $C_{max}$  do not always match.

## 8. BASIC OPERATIONS

### 8.1 Block Diagram of the Controller

### 8.2 Registers

The controller has two kinds of eight-bit registers: the instruction register (IR) and the data register (DR). They are selected by the register select (RS) signal as shown in Table 3.

The IR stores instruction codes such as Display Clear and Cursor Home, and the address information of display data RAM (DD RAM) and character generator RAM (CG RAM). They can be written from the MPU, but cannot be read to the MPU.

The DR temporarily stores data to be written into

DD RAM or CG RAM, or data read from DD RAM or CG RAM. For data write, the data written into the DR from the MPU is automatically written into DD RAM or CG RAM by internal operation. For data read, when the data address is written into the IR, the specified data is read out to the DR by internal operation. Then the MPU reads it from the DR. After the read operation, the next address is set and DD RAM or CG RAM data at the address is read into the DR for the next read operation.

Table 3 Register selection

RS	R/W	Operation
0	0	IR selection, IR write. Internal operation : Display Clear, Cursor Home, etc.
0	1	Busy flag (DB <sub>7</sub> ) and address counter (DB <sub>0</sub> to DB <sub>6</sub> ) read
1	0	DR selection, DR write. Internal operation : DR to DD RAM or to CG RAM
1	1	DR selection, DR read. Internal operation : DD RAM or CG RAM to DR

### 8.3 Busy flag (BF)

The busy flag indicates whether the module is ready to accept the next instruction. As shown in Table 3, the signal is output to DB<sub>7</sub> if RS = 0 and R/W = 1. If the busy flag is 1, the module is working internally and the instruction cannot be accepted. If the busy flag is 0, the next instruction

can be written. Therefore, the busy flag status needs to be checked before executing an instruction.

To execute an instruction without checking the flag status, wait for more than the execution time of prior instruction. For the execution time of each instruction, see section 4.9, "Instruction Outline".

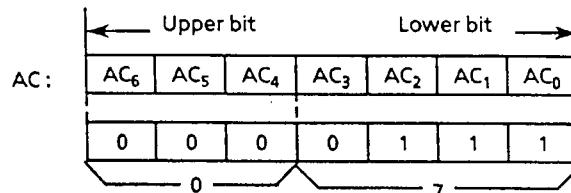

## 8.4 Address counter (AC)

The address counter specifies an address when data is written into DD RAM or CG RAM and when the data stored in DD RAM or CG RAM is read out. If an Address Set instruction (for DD RAM or CG RAM) is written in the IR, the address information is transferred from the IR to the AC. When display data is written into or read from DD RAM or CG RAM, the AC is automatically incremented or decremented by one according to the Entry Mode Set. The contents of the AC are output to DB<sub>0</sub> to DB<sub>6</sub> if RS = 0 and R/W = 1 as shown in Table 3.

## 8.5 Display data RAM (DD RAM)

DD RAM has a capacity of up to 80 × 8 bits and stores display data of 80 eight-bit character codes. Some storage areas of DD RAM that are not used for display can be used as general data RAM. A DD RAM address to be set in the AC is expressed in hexadecimal form as follows.

Example: DD RAM address “07”

The correspondence between the DD RAM address and the display digits of the LCD panel is described in the following.

- One line display (N = 0, 1/8 duty or 1/11 duty)

The DD RAM address and the display digit of the LCD panel correspond as follows.

1	2	3	23 24 25			39 40 41			78 79 80			Display digit	
00	01	02	-----	16	17	18	-----	26	27	28	-----	4D 4E 4F	
DDRAM address (HEX)													

When the display digits are less than 80, the display begins at the head position.

00	01	02	03	04	-----	23	24	25 26 27	DD RAM address (HEX)
DD RAM address (HEX)									

When the Display Shift instruction is executed, the DD RAM address and the display shift as follows. The DD RAM addresses 00<sub>H</sub> to 4F<sub>H</sub> are displayed by executing Display Shift.

<u>* Leftshift</u>					36 37 38 39 40				Display digit

1	2	3	4	5	-----	22	23	24	25	26	DD RAM address (HEX)

- Two line display (N = 1, 1/16 duty)

The DD RAM address and the display digit of the LCD panel correspond as follows.

1	2	3	-----	15	16	17	18	19	20	21	-----	38 39 40		Display digit	
Line 1	00	01	02	-----	0E	0F	10	11	12	13	14	-----	25	26	27
Line 2	40	41	42	-----	4E	4F	50	51	52	53	54	-----	65	66	67

DDRAM  
address (HEX)

When the display digits are less than 40, the display begins at the head positions of the two lines. In this case, the first line end address and the second line start address are not consecutive.

(3) L2032, L2462

In L2032, the DD RAM addresses  $00_H$  to  $13_H$  are displayed in line 1 and  $40_H$  to  $53_H$  are displayed in line 2. In L2462, the DD RAM addresses  $00_H$  to  $17_H$  are displayed in line 1 and  $40_H$  to  $57_H$  in line 2. The DD RAM addresses  $00_H$  to  $27_H$  are displayed in line 1 and  $40_H$  to  $67_H$  in line 2 by executing Display Shift.

• L1671 and L1681 ( $N = 1$ , 1/16 duty)

L1671 and L1681 are 16 characters  $\times$  1 line display and they are driven at 1/16 duty. Eight characters  $\times$  2 lines in the LCD controller are converted into 16 characters  $\times$  1 line on the LCD panel.

- L4044 (N=1, 1/16 duty)

L4044 has two LCD controllers. Since the capacity for each is 80 characters (40 characters  $\times$  2 lines), L4044 can display 160 characters (40 characters  $\times$  4 lines) by using two LCD controllers. Line 1 and line 2 are activated by E1. Line 3 and line 4 are activated by E2.

On the LCD panel

	1	2	3	4	5	-----	35	36	37	38	39	40	Display digit

Line 4	40	41	42	43	44	-----	-----	62	63	64	65	66	67

When E1 is activated and the Display Shift instruction is executed, the DD RAM address and the display for upper two lines shift as follows.

\* E1 activation and left shift

	1	2	3	4	5	-----	35	36	37	38	39	40	Display digit
Line 1	01	02	03	04	05	-----	23	24	25	26	27	00	DD RAM address (HEX)

Line 4	40	41	42	43	44	-----	62	63	64	65	66	67	

When E2 is activated and the Display Shift instruction is executed, the DD RAM address and the display shift for lower two lines as follows.

\* E2 activation and right shift

	1	2	3	4	5	-----	35	36	37	38	39	40	Display digit
Line 1	00	01	02	03	04	-----	22	23	24	25	26	27	DD RAM address (HEX)

Line 4	67	40	41	42	43	-----	61	62	63	64	65	66	

All the four lines cannot be shifted at the same time. Instructions must be written using E1 and E2 to distinguish the upper two lines from the lower two lines.

## 8.6 Character generator ROM (CG ROM)

CG ROM generates 5x7 dot-matrix or 5x10 dot-matrix character patterns from eight-bit character codes. In LCD modules of 5x7 dot-matrix character pattern, CG generates 192 types of 5x7 characters, and in LCD modules of 5x10 dot-matrix character pattern (L4051), CG generates 160 types of 5x7 dot-matrix characters and 32 types of 5x10 dot-matrix characters.

Table 4 and Table 5 show the correspondence between the CG ROM character codes and character patterns of 5x7 and 5x10 respectively.

## 8.7 Character generator RAM (CG RAM)

CG RAM is used to create character patterns freely by programming. Eight types of 5x7 dot matrix character patterns or four types of 5x10 dot matrix character patterns can be written into a CG RAM. Table 6 and Table 7 show the character patterns created from CG RAM addresses and CG RAM data. To display a created character pattern, the character code in the left column of the table is written into DD RAM corresponding to the display position (digit). The areas not used for display are available as general data RAM.

## 8.8 Cursor/Blink control circuit

The circuit generates the cursor or blink. When the address counter (AC) selects the address of DD RAM, the cursor or the blink appears in the digit corresponding to the address. When the address counter is 08H, a cursor or blink position is in the 9th digit in line 1 as shown below.

AC	AC6	AC5	AC4	AC3	AC2	AC1	AC0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	Display digit

Line 2	40	41	42	43	44	45	46	47	48	49	4A	4B	4C	4D	4E	4F								

Note: The cursor or blink also appears when the character generator RAM (CG RAM) is selected by the address counter. In this case, the cursor or blink position has no meaning.

- Notes:
- In CG RAM data, "1" corresponds to Selection and "0" to Non-selection on the display.
  - Character code bits 0 to 2 and CG RAM address bits 3 to 5 correspond to each other (three bits, eight types).
  - CG RAM address bits 0 to 2 specify a line position for a character pattern. Line 8 of a character pattern is the cursor position where the logical OR of the cursor and CG RAM data is displayed. Set the data of line 8 to "0" to display the cursor. If the data is changed to "1", bit 1 lights, regardless of the cursor.
  - The character pattern column positions correspond to CG RAM data bits 0 to 4 and bit 4 comes to the left end. CG RAM data bits 5 to 7 are not displayed but can be used as general data RAM.
  - When reading a character pattern from CG RAM, set to "0" all of character code bits 4 to 7. Bits 0 to 2 determine which pattern will be read out. Since bit 3 is not valid, 00H and 08H select the same character.

## 9. INSTRUCTION OUTLINE

When MPU controls LCD controller on the LCD module, MPU directly controls only two registers of the controller : the Instruction Register (IR) and the Data Register (DR). Prior to internal operation start, the controller temporarily stores control information in these registers, so as to interface with various types of MPUs or peripheral control ICs which operate at different speeds from speed of controller internal operation.

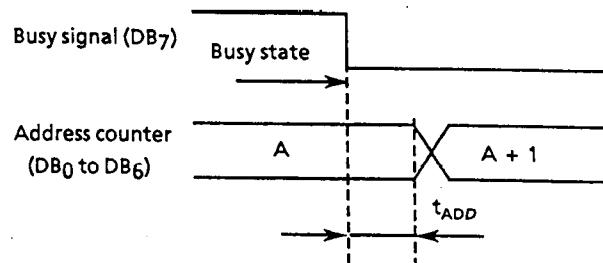

Table 8 shows the instructions and their execution time.

While the controller is executing an instruction and internal operation is in progress, the controller will accept and execute no instruction other than the Busy Flag/Address Read instruction.

Since the busy flag is set to "1" while an instruction is being executed, check the busy flag status and make sure it is "0" before sending an instruction from the MPU to the controller.

To send instructions without checking the busy flag, make sure that the interval between two instructions is much longer than the execution time of the prior instruction.

After the execution of writing/reading data instruction to/from CG/DD RAM, RAM address counter is automatically incremented or decremented by one. This increment/decrement is executed after the busy flag is set to "0". The time from the fall edge of busy flag to the end of address counter renewal ( $t_{ADD}$ ) is as shown below.

$t_{ADD}$  depends on the clock oscillation frequency ( $f_{osc}$ ).

$$t_{ADD} = \frac{1.5}{f_{osc}} \text{ (s)}$$

## 10. INITIALIZATION

### 10.1 Automatic initialization

The system is automatically initialized at power-on if the following power supply conditions are satisfied.

\*t<sub>OFF</sub> : Time when power supply is OFF if cut instantaneously or turned ON and OFF repeatedly.

In automatic initialization, the following instructions are executed.

- Display Clear
- Function Set  
DL = 1: Interface data length: Eight bits  
N = 0, F = 0: 1/8 duty, character font: 5 × 7 dot matrix

• Display ON/OFF Control

D = 0: Display OFF

C = 0: Cursor OFF

B = 0: Blink OFF

• Entry Mode Set

I/D = 1: Increment

S = 0: No display shift

Since some conditions set by initialization may not be suitable for the LCD module, execute further Function Set instruction.

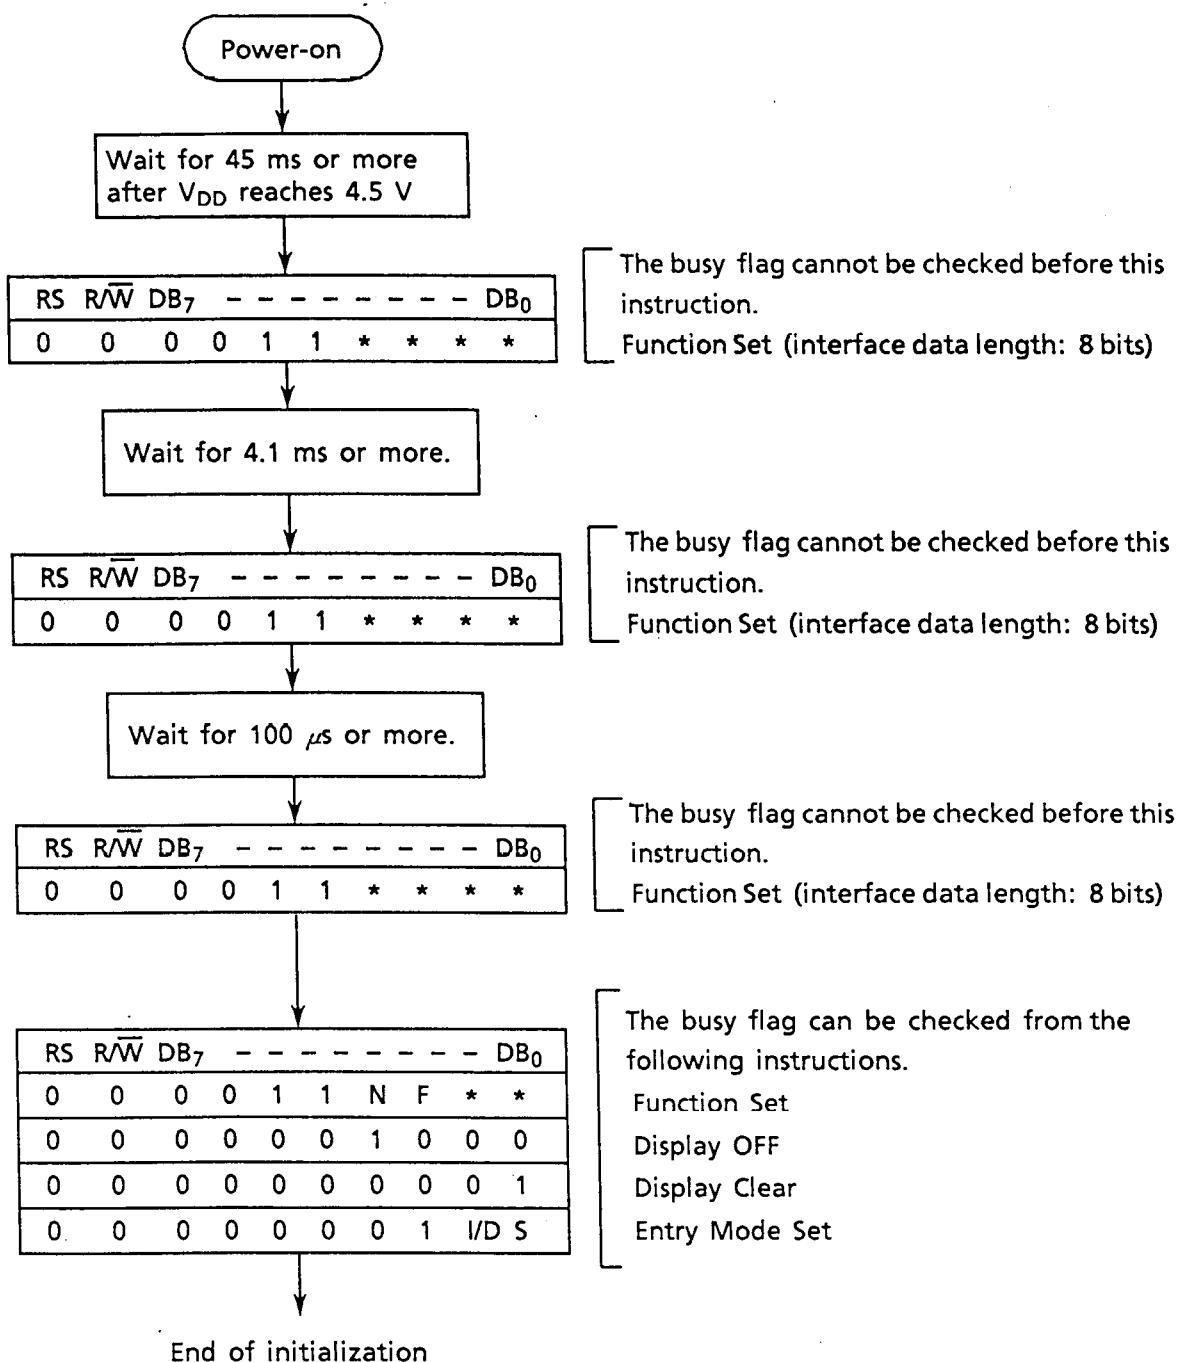

The busy flag (BF) is kept busy until initialization ends. The busy state remains for 20 ms after V<sub>DD</sub> reaches 4.5 V.

If the power supply conditions are not satisfied and automatic initialization is not executed. Execute initialization using instructions according to section 10.2, "Initialization by instruction".

If automatic initialization is not executed because the power supply conditions are not satisfied, use the following instructions to initialize. Since it is unknown whether the interface data length is set to eight bits or four bits at power on,

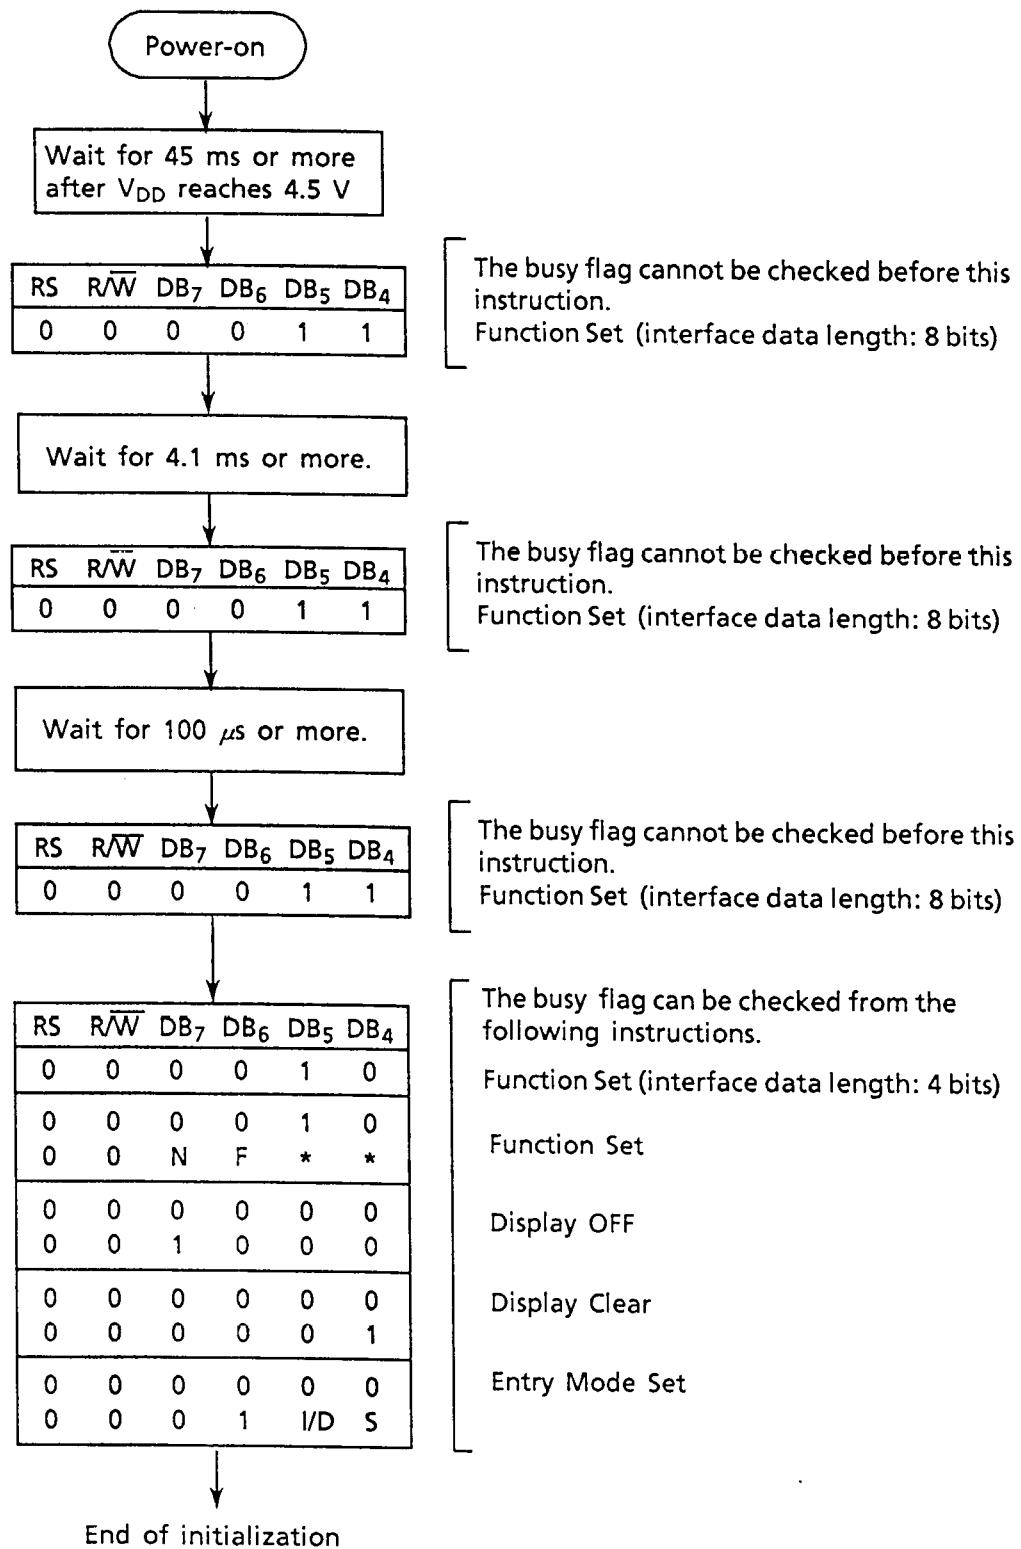

execute Function Set twice to set the interface data length to eight bits. And then set the required interface data length by executing further Function Set instruction.

## (a) Interface data length : Eight bits

Note: In L4044, execute initialization on E1 and E2 respectively.

## (b) Interface data length: Four bits

Note: In L4044, execute initialization on E1 and E2 respectively.

## 11. INSTRUCTION DETAILS

### (1) Display Clear

Code	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
	0	0	0	0	0	0	0	0	0	1

Display Clear clears all display and returns cursor to home position (address 0).

Space code 20 (hexadecimal) is written into all the addresses of DD RAM, and DD RAM address 0 is set to the AC. If it was shifted, the display returns to the original position. The cursor or blink go to the left end on line 1, except L4044. In L4044, if the cursor or blink is on line 3 or line 4, it returns to the left end of line 3. After execution of the Display Clear instruction, I/D=1 (increment) of Entry Mode is set.

### (2) Cursor Home

Code	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
	0	0	0	0	0	0	0	0	1	*

\* : Don't care bit

Cursor Home returns cursor to home position (address 0).

DD RAM address 0 is set to the AC. The display returns to the original position if it was shifted. The DD RAM contents do not change. If the cursor or blinking is ON, it returns to the left end, except L4044. In L4044, if the cursor or blink is on line 3 or line 4, it returns to the left end of line 3.

### (3) Entry Mode Set

Code	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	I/D	S	DB0
	0	0	0	0	0	0	0	1			

Entry Mode Set sets the direction of cursor movement and determines whether display is shifted.

I/D : The DD RAM address is incremented or decremented by one when a character code is written into or read from DD RAM. This is also true for writing into or reading from CG RAM.

When I/D = 1, the address is incremented by one and the cursor or blink moves to the right.

When I/D = 0, the address is decremented by one and the cursor or blink moves to the left.

S : If S = 1, the entire display is shifted either to the right or left for writing into DD RAM. The cursor position does not change, only the display moves. There is no display shift for reading from DD RAM.

When S = 1 and I/D = 1, the display shifts one digit to the left after data write to DD RAM.

When S = 1 and I/D = 0, the display shifts one digit to the right after data write to DD RAM.

If S = 0, the display does not shift.

### (4) Display ON/OFF Control

Code	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	D	C	B	DB0
	0	0	0	0	0	0	1	D	C	B		

Display ON/OFF Control turns the total display and the cursor ON and OFF, and makes the character on the cursor position start blinking. Cursor ON/OFF and blinking is done at the digit indicated by the DD RAM address specified by the AC.

D : When D = 1, the display is turned ON.

When D = 0, the display is turned OFF.

If D = 0 is used, display data remains in DD RAM. Therefore the data can be displayed again by setting D=1.

C : When C = 1, the cursor is displayed.

When C = 0, the cursor is not displayed.

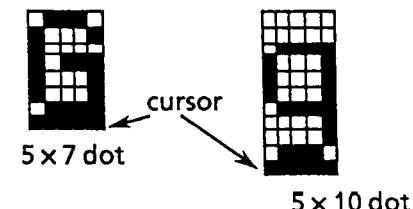

The cursor is displayed in the dot line below the character fonts.

B : When B = 1, the character at the cursor position starts blinking.

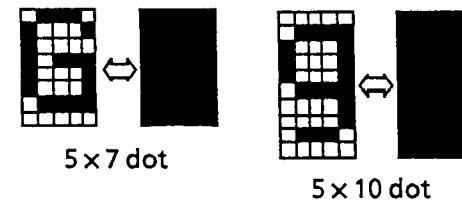

When B = 0, it does not blink.

For blinking, all-black dots and the character are switched about every 0.4 seconds when  $f_{osc}$  is 250 kHz. The cursor and blinking can be set at the same time.

- C = 1 (cursor display)

- B = 1 (blink)

### (5) Cursor/Display Shift

Code	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	S/C	R/L	*	DB0
	0	0	0	0	0	0	1	S/C	R/L	*	*	

\* : Don't care bit

Cursor/Display Shift moves the cursor and shifts the display without changing the DD RAM contents. The cursor position and the AC contents match. This instruction is useful for display correction and retrieval because the cursor position or display can be shifted without writing or reading display data. In a 2-line display, the cursor is shifted from digit 40 (DDRAM address 27) of line 1 to digit 1 of line 2. Displays of lines 1 and 2 are shifted at the same time. Display shift moves the display of each line only horizontally. Therefore, the display pattern of line 2 is not shifted to line 1, and the display pattern of line 1 is not shifted to line 2.

**Note:** L1671 and L1681 operates internally as 8 char.  $\times$  2 line-display, L1634 as 32 chars.  $\times$  2 line-display, L2034 as 40 chars.  $\times$  2 line-display, and L4044 as two displays of 40 chars.  $\times$  2 lines. See section 8.5, "Display data RAM".

		Operation							
S/C	R/L								
0	0	The cursor position is shifted to the left (the AC is decremented by one).							
0	1	The cursor position is shifted to the right (the AC is incremented by one).							
1	0	The entire display is shifted to the left with the cursor.							
1	1	The entire display is shifted to the right with the cursor.							

**Note:** If only display shift is done, the AC contents do not change.

#### (6) Function Set

RS R/W DB <sub>7</sub> ————— DB <sub>0</sub>									
Code	0	0	0	0	1	DL	N	F	*
* : Don't care bit									

Function Set sets the interface data length, the number of display lines, and the character font.

DL : Interface data length

When DL = 1, the data length is set at eight bits (DB<sub>7</sub> to DB<sub>0</sub>).

When DL = 0, the data length is set at four bits (DB<sub>7</sub> to DB<sub>4</sub>). In 4-bit interface, the upper four bits are transferred first, then the lower four bits follow.

N : When N = 1, the duty is set to 1/16.

When N = 0, the duty is set to 1/8 or 1/11.

F : Character font

When F = 1, the character font is set to 5  $\times$  10 dot matrix.

When F = 0, the character font is set to 5  $\times$  7

dot matrix.

If N is set to 1, F becomes "Don't care bit".

N	F	Number of display lines	Character font (dot matrix)	Duty	LCD module
0	0	1	5 $\times$ 7	1/8	-
0	1	1	5 $\times$ 10	1/11	L4051
1	*	2	5 $\times$ 7	1/16	L1671, L1681, L1672 L1682, L1692, L1634 L2032, L2034, L2462 L4052, L4044

\* Don't care bit

Function Set instruction must be executed prior to all other instructions except Busy Flag/Address Read. If another instruction is executed first, no Function Set instruction except changing the interface data length is effective.

#### (7) CG RAM Address Set

RS R/W DB <sub>7</sub> ————— DB <sub>0</sub>									
Code	0	0	0	1	A	A	A	A	A
	———— Upper bit      Lower bit —————								

CG RAM addresses expressed as binary AAAAAAA are set to the AC. Then data written from or read to the MPU is for the CG RAM.

#### (8) DD RAM Address Set

RS R/W DB <sub>7</sub> ————— DB <sub>0</sub>									
Code	0	0	1	A	A	A	A	A	A
	———— Upper bit      Lower bit —————								

DD RAM addresses expressed as binary AAAAAAAA are set to the AC. Then data written from or read to the MPU is for the DD RAM. When N = 0 (one-line display: L4051), the addresses are 00<sub>H</sub> to 4F<sub>H</sub>. When N = 1 (two-line display: L1672, L1682, L1692, L2032, L2462, L4052), the addresses used for display in line 1 (AAAAAAA) are 00<sub>H</sub> to 27<sub>H</sub> and those for line 2 (AAAAAAA) are 40<sub>H</sub> to 67<sub>H</sub>. As for L1671, L1681, L1634, L2034 and L4044, see section 8.5, "Display Data RAM".

#### (9) Busy Flag/Address Read

RS R/W DB <sub>7</sub> ————— DB <sub>0</sub>									
Code	0	1	BF	A	A	A	A	A	A
	———— Upper bit      Lower bit —————								

The BF signal is read out, indicating whether the module is working internally because of the previous instruction.

When BF = 1, the module is working internally and the next instruction cannot be accepted until the BF value becomes 0.

When BF = 0, the next instruction can be accepted. Therefore, make sure that BF = 0 before writing the next instruction.

The AC values binary AAAAAAAA are read out at the same time as the busy flag read. The AC addresses are used for both CG RAM and DD RAM, and the Address Set before the execution of this instruction determines whether the address is for CG RAM or DD RAM.

#### (10) Data Write to CG RAM or DD RAM

Code	RS	R/W	DB <sub>7</sub>	DB <sub>6</sub>	DB <sub>5</sub>	DB <sub>4</sub>	DB <sub>3</sub>	DB <sub>2</sub>	DB <sub>1</sub>	DB <sub>0</sub>
	1	0	D	D	D	D	D	D	D	D

← Upper bit                      Lower bit →

Binary eight-bit data DDDDDDDDD is written into CG RAM or DD RAM. CG RAM Address Set or DD RAM Address Set before this instruction selects either RAM. After the write operation, the address is incremented or decremented automatically according to Entry Mode Set. Entry Mode Set also determines whether display shifts or not after the write operation.

#### (11) Data Read from CG RAM or DD RAM

Code	RS	R/W	DB <sub>7</sub>	DB <sub>6</sub>	DB <sub>5</sub>	DB <sub>4</sub>	DB <sub>3</sub>	DB <sub>2</sub>	DB <sub>1</sub>	DB <sub>0</sub>
	1	1	D	D	D	D	D	D	D	D

← Upper bit                      Lower bit →

Binary eight-bit data DDDDDDDDD is read from CG RAM or from DD RAM. CG RAM Address Set or the DD RAM Address Set before this instruction selects either RAM. CG RAM Address Set or the DD RAM Address Set must be executed immediately before this instruction. If no Address Set instruction is executed before a read instruction, the first read data is invalid. Data is normally read from the second time, if read instructions are executed consecutively. For DD RAM, if Cursor Shift instruction is executed just before reading DD RAM, there is no need to execute an Address Set instruction because the Cursor Shift instruction does this.

After a read operation, the address is automatically incremented or decremented by one according to Entry Mode Set, but the display is not shifted regardless of Entry Mode Set.

Note : The AC is automatically incremented or decremented by one according to Entry Mode Set after Data Write to CG RAM or DD RAM instruction is executed. If a read instruction is executed immediately after this instruction, RAM data specified by the AC is not read out.

Correct data is read out under the following conditions.

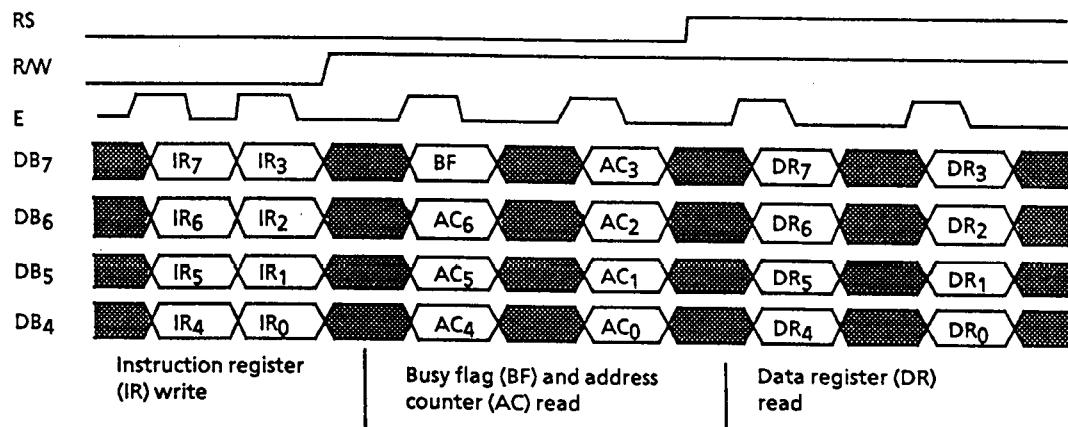

- An Address Set instruction is executed immediately before a read instruction
- For DD RAM, the Cursor Shift instruction is executed immediately before a read instruction
- The second, or later, instruction is executed in consecutive execution of read instructions.

## 12. INTERFACING TO MPU

LCD modules containing controller can interface to both 4 bit and 8 bit MPUs.

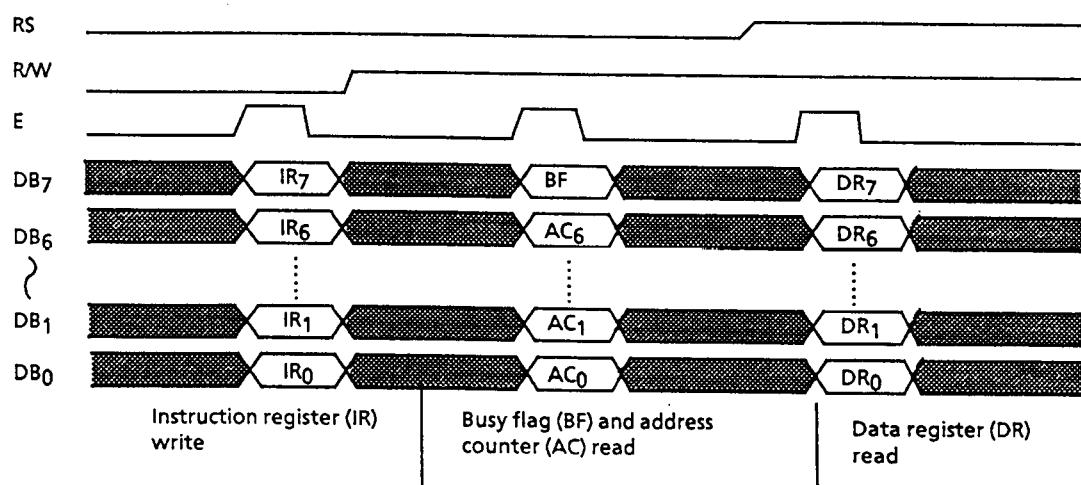

### 12.1 Interface in 4-bit operation

When interface data is 4 bits long, data is transferred using only four buses: DB<sub>4</sub> to DB<sub>7</sub>. DB<sub>0</sub> to DB<sub>3</sub> are not used. Data transfer between the controller and the MPU ends when 4-bit data is transferred twice. Data of the higher order 4 bits (contents of DB<sub>4</sub> to DB<sub>7</sub> when interface data is 8 bits long) are transferred first, then lower order 4 bits (content of DB<sub>0</sub> to DB<sub>3</sub> when interface data is 8 bits long ) are transferred. Check the busy flag after 4-bit data has been transferred twice. Then the busy flag and address counter data are read out by two transfers.

### 12.2 Interface in 8-bit operation

When interface data is 8 bits long, data is transferred using the 8 data buses of DB<sub>0</sub> to DB<sub>7</sub>.

## 15. INTERFACE PROBLEMS AND CHECK POINTS

### 15.1 Phenomena

- (1) Display is blank after power-on and initialization.
  - ◎ See Causes and check: ① to ⑦
- (2) Wrong display or missing display
  - ◎ See Causes and check: ③ to ⑩
- (3) ICs become hot.
  - ◎ See Causes and check: ①, ⑪, ⑫, ⑬
- (4) Input data is not displayed in correct order.
  - In L1671 and L1681, display at digit 8 does not shift to digit 9.
  - In 2-line module except L4052, display at the last digit of line 1 does not shift to the first digit of line 2.
  - In L1634 and L2034, display at the last digit of line 1 does not shift to the first digit of line 2, but shifts to the first digit of line 3.
  - In L4044, display at the last digit of line 2 does not shift to line 3.
- ◎ See Causes and Check: ⑤, ⑭, ⑮

### 15.2 Causes and check

- ① Check that the power supplies ( $V_{DD} = 5\text{ V}$ ,  $V_{SS} = 0\text{ V}$ ) are connected.
- ② Check that adequate voltage is being applied to  $V_{LC}$  terminal. See "Power Supply" in section 5, "Specifications" of individual LCD modules.
- ③ Check that input/output pins are set in correct order.
- ④ Check that data is not being transmitted too fast.
  - Is busy being checked on operation ?
  - If busy check is not performed, is there sufficient interval between instructions?
- ⑤ Check that initialization has been properly performed. See section 10, "Initialization".
- ⑥ Check that enable fall time is 25 ns or less.
- ⑦ Check that enable pulse width is 220 ns or more.

- ⑧ Check that other peripheral equipment is not in contention with the data bus (chip select problem).
- ⑨ Check that signal levels (TTL level) are not too low.
- ⑩ Check that all data bus components have TTL type outputs.
- ⑪ Check that  $V_{DD}$  and  $V_{SS}$  are not connected inversely.
- ⑫ Check that too much voltage is not applied to  $V_{DD}$ .
- ⑬ Check that no input signal is applied when the power source of  $V_{DD}$  terminal is off.
- ⑭ Check the relation between the DD RAM address and the display digit, and execute correct DD RAM Address Set instruction. See section 8.5, "Display Data RAM".
- ⑮ Check that initialization has been performed for E1 and E2 respectively in L4044, which has two controllers and requires E1 for lines 1 and 2, and E2 for lines 3 and 4.
